

Magnet Application and Care

It's important to apply magnets only when both the vehicle surface and the magnet itself are clean and dry. Your vehicle should be waxed prior to applying.

We recommend that magnets not be applied or removed when the temperature is below 40 degrees. The magnet material may freeze and can snap if bent while cold. If the vehicle surface is very cold, frost or condensation may be present, preventing a good grip by the magnet material.

An occasional generous waxing of both the surface where the sign will be placed and the back of the sign itself can prevent damage to the vehicle surface.

Remove all magnets at least weekly. Clean and wipe dry both the magnetic side and the surface of the vehicle, then re-apply. We recommend users change the position of magnets when reapplying. During warmer, humid weather, remove magnets every 3 or 4 days to prevent moisture from building up under the magnet, which may result in damage to the surface. To clean, simply wash magnet with warm water and a mild dish detergent. Rinse and wipe dry before reapplying to vehicle.

We make no warranty (expressed or implied) against loss of magnets or damage to vehicle surfaces, as we have no control over how magnets are cared for, altered, stored, and/or used, or the surface to which the magnets are applied.
